

How far apart are observation embeddings within an episode, and overall?

Density of pairwise Euclidean distances over three nested pair populations: aqua = consecutive steps of an episode, blue = any two steps of the same episode, orange = any two steps of the task with episode identity ignored. Each panel has its own x-axis -- the embedding dimension and scale differ per task -- so compare the curves within a panel, not across panels. The x range is clipped at the 99.9th percentile of the widest population.

consecutive steps within episode pooled over all episodes
