

Where the criterion looks, and where TWA actually is -- kern_cd_flat on sorting

289 cells; both bandwidths swept over 2^{-4} .. 2^4 times their median heuristic, sigma_phi left at it.

Headline TWA at the median heuristic 0.560, at the criterion's pick 0.584, at the best cell in the grid

0.622. The middle panel's colour range is clipped below its 20th percentile, so the structure near the maximum survives the barrier's dive.

- ✖ median heuristic
- criterion ($\alpha=0.05, \beta=1$)
- best TWA in the grid
