

The log-determinant criterion against the median heuristic, kern_cd_flat on 5 tasks

Which bandwidths each rule picks, per task. Both oracle rules are chosen by the test-set TWA they produce and cannot be run in practice; they bound what the criterion could reach.

-  criterion ($\alpha=0.05, \beta=1$)
-  criterion, best knobs (oracle)
-  best bandwidths in the grid (oracle)
-  median heuristic
